**Abstract:** An inventory to prepare the checklist of angiosperm species in the lateritic hillocks of northern Kerala was conducted in five sampling sites during April 2013–March 2015. In total, we recorded 364 genera with 535 species, of which 334 are native and 201 are non-native. Native species were represented in 102 families, namely, Poaceae (28), Fabaceae (25), Acanthaceae (22), Rubiaceae (17) Euphorbiaceae (14), Commelinaceae (11), Phyllanthaceae (7), etc., whereas, non-native species were represented in 99 families. Among the native species herbs are the predominant habit with 147 species (44%). Out of the 72 endemic species, three taxa namely, *Syzygium travancoricum*, *Santalum album* and *Hopea ponga* are red listed species documented from the study area. Twenty-seven invasive species were also recorded and major threats to the laterite ecosystems are by *Lantana camara*, *Mikania micrantha*, *Pennisetum polystachyon*, *Ipomoea* spp., and *Senna* spp. Most part of the laterite has been converted to plantations, building sites and mining sites. The indiscriminate mining for laterite, soil and demolishing the hillocks have severely threatened the very existence of the flora.

**Keywords:** Endemism, floristic inventory, lateritic plateau, microhabitats.

**Editor:** Sanjaykumar R. Rahangdale, PDEA's A. W. Arts, Science & Commerce College, Pune, India.

**Date of publication:** 26 June 2020 (online & print)

**Author details:** DR. K. A. SREEJITH, is a Senior Scientist at KFRI involved in field oriented studies of tropical forests in Western Ghats especially on long term monitoring permanent plots. DR. V.B. SREEKUMAR, Senior Scientist in Forest Botany Department working in the field of floristics, plant systematics, phylogenetics, genetic diversity assessments and long term changes in phenology and seed dispersal of angiosperms. DR. P. PRASHOB, S. NITA, M.P. PREJITH and M.S. SANIL were working as project staff in the lateritic hillocks of northern Kerala on different aspects dealing with diversity, distribution and ecology of flora and fauna.

**Author contribution:** KAS—contributed to field survey, identification and paper writing; VBS—contributed to field survey, identification and paper writing; PP—contributed to field survey and identification; NS—contributed to paper writing; MPP—contributed to field survey; MSS—contributed for preparation of herbarium and paper writing.

**Acknowledgements:** We express our sincere thanks to the Director, Kerala Forest Research Institute for support, encouragement and facilities provided. We are also thankful to the Kerala State Council for Science, Technology & Environment and the Government of Kerala for providing financial support under plan grants (Project No KFRI RP 652/12).

## INTRODUCTION

Francis Hamilton-Buchanan from Angadipuram in Kerala, India in the 1800s, while on a journey through the regions of Mysore, Canara, and Malabar (Buchanan 1807; Narayanaswamy 1992) came across a type of weathered substance. This substance used in building material, consisted of indurated clay, full of cavities and pores. It had large quantities of iron in the form of red and yellow ochre. Soft when fresh, this could be cut with any iron instrument; but if exposed, it hardened and resisted air and water. This came to be known as laterite. This unique geological formation is reported to occur from Karnataka, Kerala, Maharashtra, Madhya Pradesh in central India, the Eastern Ghats regions of Odisha, from parts of Assam, and more (Raychaudhuri 1981).

Floristic studies in lateritic plateaus have reported occurrence of many endemic species and habitat-specific flora (Bachulkar 1983; Yadav & Sardesai 2002; Watve 2013; Rahangdale & Rahangdale 2014) throughout the Western Ghats, India.

Some of the new species discovered from laterite ecosystems in India include *Rotala malabarica* Pradeep, Joseph & Sivar. (Pradeep et al. 1990), *Nymphoides krishnakesara* Joseph & Sivar. (Joseph & Sivarajan 1990), *Justicia ekakusuma* Pradeep & Sivar. (Pradeep & Sivarajan 1991), *Lepidagathis keralensis* Madhu. & Singh (Madhusoodanan & Singh 1992), *Eriocaulon sivarajanii* R. Ansari & N.P. Balakr. (Ansari & Balakrishnan 2009), and *Eriocaulon madayiparnese* Swapna, Rajesh, Manju & Prakashkumar (Swapna et al. 2012). There are so many new discoveries from the plateau ecosystems from the Western Ghats and especially from lateritic ones. Therefore, the basaltic as well as lateritic plateaus are inhabited by a great diversity of flora. The plateaus are very species rich, for example the Durgawadi Plateau in Maharashtra of three square kilometer area has more than 600 angiospermic taxa of which 150 are endemic and also 105 faunal members (Rahangdale & Rahangdale 2018), which indicates the extent of species richness on the isolated hillocks or plateaus in the Western Ghats.

Some other taxa also described from laterite habitats, especially from the Western Ghats and adjoining areas are: *Ceropegia attenuata* Hook. var. *mukambikae* (Diwakar & Singh 2011) from Mookambika Hills, Karnataka, *Ceropegia anantii* (Yadav et al. 2004), *Dipcadi concanense* (Dalzell) Baker (Prabhugaonkar et al. 2009), both from low elevation laterites of the Konkan region in Maharashtra, and *Ceropegia mahabalei* Hemadri & Ansari var. *hemalatae* (Rahangdale & Rahangdale

2012) from basaltic plateaus of high elevation from the Western Ghats, Maharashtra.

Recent reports of new angiosperm species like *Lindernia madayiparens* Ratheesh, Sunil & Nandakumar, *Eriocaulon madayiparens* Swapna, Rajesh, Manju & Prakashkumar, *Eriocaulon kannurense* Sunil, Ratheesh & Nandakumar, and *Rotala khaleeliana* Sunil, Ratheesh & Nandakumar from the lateritic hills in northern Kerala highlights the importance of these ecosystems in terms of floral diversity and species richness. Though many endemic and new species have been reported from the lateritic hills of northern Kerala, floral inventory of these ecosystem are limited (Jayarajan 2004; Balakrishnan et al. 2010). Hence, this study was undertaken to document floristic composition and to highlight the significance of these ecosystem in the laterite hills of low elevations of northern Kerala.

## MATERIALS AND METHODS

### Study Site

The lateritic regions are a unique feature of northern Kerala and are found from Malappuram District in the south and extend upwards to southern Karnataka towards the north. For the present study, intensive surveys were conducted in three lateritic hillocks of Cherupara, IT park, and Kookanam of the Kavvayi Basin ( $12.087^{\circ}$ – $12.262^{\circ}$  N &  $75.179^{\circ}$ – $75.236^{\circ}$  E), spread across Kannur and Kasargod districts. Additionally, lateritic hills of Ariyittapara and Madayipara were also selected. Madayipara ( $12.031^{\circ}$  N &  $75.258^{\circ}$  E) is a popular and typical lateritic plateau in Kannur District and lies on the north bank of Kuppam River, located in Madayi Village. Ariyittapara ( $12.248^{\circ}$  N &  $75.280^{\circ}$  E) is a lesser known hillock in Cheemeni, Kasargod (Figure 1). The altitude gradient of the selected sites ranges from 23m to about 140m. The vegetation in these midland hillocks support scrub jungles, cashew plantations, grasslands, and aquatic & semiaquatic plants.

### Data Collection

Field surveys were conducted in the five selected sampling sites from April 2013 to March 2015. Survey frequency was thrice a month during the months of June to September for extensive representation of monsoon ephemeral plants that are characteristic of lateritic hillocks and monthly for the remaining months of the year. The collected plant specimens were processed using standard herbarium techniques, identified with the aid of regional floras (Hooker 1872–1897; Gamble

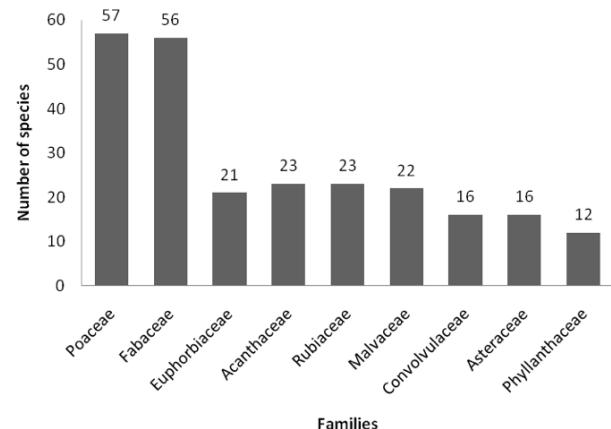

**Figure 1. Study Sites: Kavvayi River Basin (boundary marked in red), Madayipara, and Ariyittapara.**

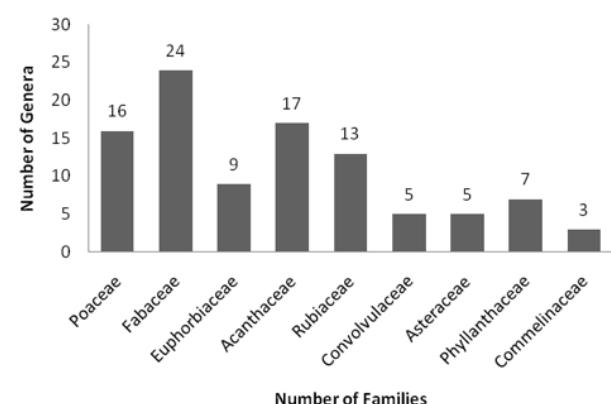

1915–1935; Ramachandran & Nair 1988; Sasidharan 2004, 2007) and deposited at the Kerala Forest Research Institute Herbarium (KFRI). A checklist was prepared based on the APG IV system of classification and the families and species are arranged alphabetically. Information such as habit, endemism, Red List category if any of each taxon is also provided.

## RESULTS

During the present study a total of 535 species belonging to 364 genera of 102 families were recorded from the study area (Table 1). Eight predominant families (i.e., with number of species  $\geq 15$  in each family), namely Poaceae (57 species), Fabaceae (56 species), Acanthaceae (23 species), Rubiaceae (23 species), Malvaceae (22), Euphorbiaceae (21 species), Asteraceae (16) and Convolvulaceae (16 species) were listed. Families with the greatest number of genera included Fabaceae (39 genera), Poaceae (35 genera), Euphorbiaceae (12 genera), Acanthaceae (17 genera),

**Figure 2. Plant families with higher native species richness in the study area.**

**Figure 3. Plant families with highest number of genera native in the study area.**

Rubiaceae (16 genera) and Asteraceae (15 genera).

Of the flora documented 2.25% were magnoliids, 21.75% were monocots and the remaining 76% were eudicots comprising rosids (39.8%) and asterids (36.2%). Among the native species of lateritic hills of northern Kerala, herbaceous species were the predominant habit (147 species: 44% of the total) followed by trees (87 species, 26% of the total), climbers (55 species, 16%), and shrubs (45 species, 14%) (Figure 4). Out of the 535 species, 334 are native and 201 are non-native species. Native species were represented in 102 families, namely Poaceae (28), Fabaceae (25), Acanthaceae (22), Rubiaceae (17), Euphorbiaceae (14), etc. (Figure 2). Families with the greatest number of genera in the native species are Fabaceae (27), Poaceae (16), Acanthaceae (17), Rubiaceae (13), Euphorbiaceae (9), etc. (Figure 3). Whereas, non-native species were represented in 99 family and dominated by Poaceae (32), Fabaceae (27), Malvaceae (17), Convolvulaceae (11), etc. Twenty-

**Figure 4. Percentage distribution of native plant habits of the documented species.**

seven invasive species were recorded and major threats to the laterite ecosystems are by *Lantana camara* L., *Mikania micrantha* Kunth, *Pennisetum polystachyon* Schult., *Ipomoea* spp., and *Senna* spp.

Of the 334 native species reported, *Asparagus fujsonii* Macbr., *Eriocaulon cuspidatum* Dalz., *Neanotis rheedei* (Wall. ex Wight & Arn.) Lewis are listed as Endangered; *Capparis baducca* L., *Cyanotis burmanniana* Wight, *Ischaemum burmanicum* Bor., and *Murdannia lanuginosa* (Wall. ex Clarke) Bruckn. as Vulnerable (Sasidharan 2007); whereas *Syzygium travancoricum* Gamble is listed as Critically Endangered (CAMP Workshops on Medicinal

Plants, India 1998), *Hopea ponga* (Dennst.) Mabb. as Endangered (Ashton 1998) and *Santalum album* L. are listed as Vulnerable (Arunkumar et al. 2019). Important plant species images are also provided (Image 1–4).

## DISCUSSION

The alteration in wet and dry spells creates unique microhabitats that support the varied biota in it. The microhabitats and larger area could be the reasons for accommodating more angiosperms (Rahangdale & Rahangdale 2014). Most of the lateritic flora is adapted to the various microhabitats and each microhabitat is unique in its edaphic properties, water availability, and species composition. This makes such floristic studies ecologically significant. Floral inventories as provided here contribute to understanding and highlighting the ecological significance of the landscape. The current inventory adds to the floristic knowledge of lateritic hills in these areas. The floristic composition may differ from site to site, but in general these (Table 1) were the frequent families recorded during the study in the lateritic hills in northern Kerala.

Also, of the seven new species recorded from lateritic hills of northern Kerala over the years, only two species were observed during the current study. These are *Justicia ekakusuma* Pradeep & Sivar. and *Rotala malabarica* Pradeep et al. Most of the lateritic

exposed areas have been converted into industrial and residential areas. Infrastructure developments lead to mining and extraction of more lateritic hills and the soil from the mining are used to fill wetland and paddy field which again utilized for building and infrastructure development. This series of events in turn seriously affected the natural environment of the lateritic biotopes in northern Kerala (Sreejith et al. 2016). The indiscriminate mining for laterite & soil and demolishing the hillocks have severely threatened the very existence of the biota, culture, and the water availability in most areas (Balakrishnan et al. 2010). Currently, these systems in the lateritic hills are undergoing severe degradation, destruction, alteration through various activities such as mining, shifting to monoculture plantation, rapid infrastructure development, and from alien invasive species. Since only a small portion of this landscape remains undisturbed, an urgent intervention from concerned authorities to formulate and implement strict guidelines & policies to conserve the species-rich lateritic biotope, to evolve & implement site-specific restoration, and conservation programmes are to be initiated & implemented to protect the floristically rich lateritic hillocks of northern Kerala.

## Communications

Dusky Langurs *Trachypithecus obscurus* (Reid, 1837) (Primates: Cercopithecidae) in Singapore: potential origin and conflicts with native primate species  
– Andie Ang, Sabrina Jabbar & Max Khoo, Pp. 15967–15974

A new report on mixed species association between Nilgiri Langurs *Semnopithecus johnii* and Tufted Grey Langurs *S. priam* (Primates: Cercopithecidae) in the Nilgiri Biosphere Reserve, Western Ghats, India  
– K.S. Chetan Nag, Pp. 15975–15984

A review of the bacular morphology of some Indian bats (Mammalia: Chiroptera)  
– Bhargavi Srinivasulu, Harpreet Kaur, Tariq Ahmed Shah, Gundena Devender, Asad Gopi, Sreehari Raman & Chelmala Srinivasulu, Pp. 15985–16005

Status of the Critically Endangered Bengal Florican *Houbaropsis bengalensis* (Gmelin, 1789) in Koshi Tappu Wildlife Reserve, Nepal  
– Hem Sagar Baral, Tek Raj Bhatt, Sailendra Raj Giri, Ashok Kumar Ram, Shyam Kumar Shah, Laxman Prasad Poudyal, Dhiraj Chaudhary, Gitanjali Bhattacharya & Rajan Amin, Pp. 16006–16012

Observations on breeding behaviour of a pair of endangered Egyptian Vultures *Neophron percnopterus* (Linnaeus, 1758) over three breeding seasons in the plains of Punjab, India  
– Charn Kumar, Amritpal Singh Kaleka & Sandeep Kaur Thind, Pp. 16013–16020

Additions to the cicada (Insecta: Hemiptera: Cicadidae) fauna of India: first report and range extension of four species with notes on their natural history from Meghalaya  
– Vivek Sarkar, Cuckoo Mahapatra, Pratyush P. Mohapatra & Manoj V. Nair, Pp. 16021–16042

The perceptions of high school students on the habitat of the crab *Ucides cordatus* (Linnaeus, 1763) (Crustacea: Decapoda: Ucididae) in northern Rio de Janeiro State, southeastern Brazil  
– Laiza Fernanda Quintanilha Ribeiro, Laura Helena de Oliveira Côrtes & Ana Paula Madeira Di Beneditto, Pp. 16043–16047

Woody species diversity from proposed ecologically sensitive area of northern Western Ghats: implications for biodiversity management  
– M. Tadwalkar, A. Joglekar, M. Mhaskar & A. Patwardhan, Pp. 16048–16063

Resolving taxonomic problems in the genus *Ceropegia* L. (Apocynaceae: Asclepiadoideae) with vegetative micromorphology  
– Savita Sanjaykumar Rahangdale & Sanjaykumar Ramlal Rahangdale, Pp. 16064–16076

A checklist of angiosperm flora of low elevation lateritic hills of northern Kerala, India  
– K.A. Sreejith, V.B. Sreekumar, P. Prashob, S. Nita, M.P. Prejith & M.S. Sanil, Pp. 16077–16098

Phytodiversity of chasmophytic habitats at Olichuchattam Waterfalls, Kerala, India  
– Arun Christy & Binu Thomas, Pp. 16099–16109

Contribution to the macromycetes of West Bengal, India: 51–56  
– Diptosh Das, Entaj Tarafder, Meghma Bera, Anirban Roy & Krishnendu Acharya, Pp. 16110–16122

## Short Communications

Catalogue of herpetological specimens from peninsular India at the Sálim Ali Centre for Ornithology & Natural History (SACON), India  
– S.R. Ganesh, S. Bhupathy, P. Karthik, G. Babu Rao & S. Babu, Pp. 16123–16135

Osteological description of Indian Skipper Frog *Euphlyctis cyanophlyctis* (Anura: Dicroglossidae) from the Western Ghats of India  
– Pankaj A. Gorule, Sachin M. Gosavi, Sanjay S. Kharat & Chandani R. Verma, Pp. 16136–16142

## Member

DNA barcode reveals the occurrence of Palearctic *Olepa schleini* Witt et al., 2005 (Lepidoptera: Erebidae: Arctiinae) from peninsular India with morphological variations and a new subspecies  
– Aparna Sureshchandra Kalawate, Shital Pawara, A. Shabnam & K.P. Dinesh, Pp. 16143–16152

Present status of the genus *Sphrageidus* Maes, 1984 (Lepidoptera: Erebidae: Lymantriinae) from India  
– Amritpal Singh Kaleka, Devinder Singh & Gagan Preet Kour Bali, Pp. 16153–16160

Early stages of Nilgiri Grass Yellow *Eurema nilgiriensis* (Yata, 1990) (Lepidoptera: Pieridae), with a note on its range extension in the Kerala part of the Western Ghats, India  
– Balakrishnan Valappil & V.K. Chandrasekharan, Pp. 16161–16165

## Notes

Breeding site records of three sympatric vultures in a mountainous cliff in Kahara-Thathri, Jammu & Kashmir, India  
– Muzaaffar A. Kichloo, Sudesh Kumar & Neeraj Sharma, Pp. 16166–16169

First distribution record of Elongated Tortoise *Indotestudo elongata* (Blyth, 1853) (Reptilia: Testudinidae) from Bihar, India  
– Arif, Sourabh Verma, Ayesha Mohammad Maslehuddin, Uttam, Ambarish Kumar Mall, Gaurav Ojha & Hemkant Roy, Pp. 16170–16172

The niche of shrimp stocks (*Xiphopenaeus kroyeri* Heller, 1862) from southeastern Brazil: a stable isotope approach  
– Keltony de Aquino Ferreira, Leandro Rabello Monteiro & Ana Paula Madeira Di Beneditto, Pp. 16173–16176

First record of the White Tufted Royal *Pratapa deva lila* Moore, [1884] (Lepidoptera: Lycaenidae: Theclinae) from Himachal Pradesh, extending its known range westwards  
– Sanjay Sondhi, Pp. 16177–16179

Range extension of the Lilac Silverline *Apharitis lilacinus* to southern Rajasthan and a review of the literature  
– K.S. Gopi Sundar, Swati Kittur, Vijay Kumar Koli & Utkarsh Prajapati, Pp. 16180–16182

A record of gynandromorphism in the libellulid dragonfly *Crocothemis servilia* (Insecta: Odonata) from India  
– R.V. Renjith & A. Vivek Chandran, Pp. 16183–16186

Carcass consumption by *Nasutitermes callimorphus* (Blattodea: Isoptera) in highland forests from Brazil  
– Igor Eloi, Mário Herculano de Oliveira & Maria Avany Bezerra-Gusmão, Pp. 16187–16189

New records of nasutiform termite (Nasutitermitinae: Termitidae: Isoptera) from Meghalaya, India  
– Khirod Sankar Das & Sudipta Choudhury, Pp. 16190–16192

## Corrigendum

Corrections to A citizens science approach to monitoring of the Lion *Panthera leo* (Carnivora: Felidae) population in Niokolo-Koba National Park, Senegal  
– Dimitri Dagorne, Abdoulaye Kanté & John B. Rose, Pp. 16193–16194
