**Abstract:** There is always a need for novel, high quality, functional and inexpensive foods among consumers in the global markets. Leafy vegetables can fulfill such needs. Leafy vegetables are now used worldwide as food for their nutritional and medicinal values. In the present work an ethnobotanical survey was carried out on the utilization of edible plants by local communities of the Terai-Dooars Region of West Bengal. The information has been documented by interviewing traditional farmers, herbalists, various older men and women following different ethnobotanical methods. A total of 103 plant species under 44 families with their short botanical description, use, range of demands and cultivation status have been documented.

**Keywords:** Ethnobotany, indigenous, leafy vegetable, Terai-Dooars, tribe.

A large section of the population of the globe fulfil their nutritional requirements through the consumption of various leafy vegetables (Singh & Arora 1978). Technically, leafy vegetables refer to leaves of any plants used as vegetables, sometimes accompanied by petioles and shoots. In most cases, leafy vegetables are consumed for their nutritional values without much consideration for their medicinal importance. Leafy vegetables are primarily composed of polysaccharides, cellulose, hemicellulose, pectin, gum mucilage and some non-carbohydrate components (Islam et al. 2004). Epidemiological studies indicate that increased intake of leafy vegetables is associated with a decreased risk of nutrient depletion disorders as well as some serious

diseases like cancers, cardiovascular disease, cataract, and other age-related diseases (Acho et al. 2014). Leafy vegetables deserve much attention in rural areas because of their possible usefulness during famine and similar scarcity situations. Rural tribal communities in many parts of the world depend on wild plants to fulfill their dietary requirements and these play a crucial role in their food security (Prasad et al. 2008). To earn additional income, they also sell them in their local markets. To fulfill the demands of the local markets several varieties of these leafy vegetables are either collected from the wild habitat or cultivated locally or even commercially. In the Terai-Dooars region of West Bengal, people have a long history of consuming leafy vegetables.

The Terai and Dooars region politically constitute the plains of Darjeeling District, the whole of Jalpaiguri and Alipurduar districts and the upper region of Cooch Behar District in West Bengal. The slope of the land is gentle, from north to south. The general height of the land is 80–100 m. The entire region is made up of sand, gravel and pebbles laid down by the Himalayan rivers namely, the Teesta, Torsa, Raidak, Jaldhaka, Sankosh and several other small rivulets. The Teesta has divided the area into two parts—the western part is known as the Terai whereas the eastern part is known as the Dooars

or Duars. The area Dooars starts from the eastern bank of the river Teesta in the Jalpaiguri District stretching up to the western bank of the river Sankosh in Alipurduar District, spreading over a span of around 130km of which 40km area runs along the Himalayan foothills. This region is highly populated and characterized by the presence of different tribal communities. The local consumption of these leafy vegetables and their increased demand in the market, can create a threat to some species especially the wild species of this region. To overcome such problems the people of this region cultivate such threatened plants either in their home gardens for local consumption or in agricultural fields for marketing. Thus there is a real need of maintaining proper records of leafy vegetables and their status of conservation through agricultural practices. The present study was designed to evaluate the level of utilization, availability and cultivation practices of leafy vegetables of this region.

## MATERIALS AND METHODS

### Study Area

The present study was carried out in several rural and semi-urban areas of Terai-Dooars region of West Bengal, India. To record the indigenous and under-utilized leafy vegetables, extensive field surveys were conducted during three consecutive years between January 2016 to March 2019. For this study several tribal villages, rural markets and agricultural fields were visited. The plant specimens were collected, mounted on herbarium sheets and identified through the available

taxonomic literature, books and some relevant articles. Data was collected through a combination of tools and questionnaires. The information thus gathered was compared with available literature sources.

## RESULTS AND DISCUSSION

The present work is the outcome of ethno-botanical field survey of three consecutive years from different villages and markets of Terai-Dooars region of West Bengal. During the present investigation, it was found that 103 plant species are used as leafy vegetables in the study site. Most of the plants are used as health food and some are used only as medicines. The edible plants also have some medicinal values. The study records a total of 103 plant species belonging to 44 families (Table 1). The study provides important evidence about traditional knowledge and diversity of wild and cultivated leafy vegetables. Among the leafy vegetables, 54.81% are in high demand, 21.15% are in moderate demand, and 24.04% are rarely demanded. The study also reveals that among the plants 72.12% are collected or cultivated due to their edible leaves but 27.88% plants are notable for other parts like fruits, seeds, rhizomes, and leaves are of secondary importance.

## CONCLUSION

These leafy vegetable plants and their utilization is well recognized by the local communities. It was observed that the majority of the local inhabitants were dependent on wild vegetation for under-utilized leafy vegetables but over-utilized leafy vegetable plants were

commercially cultivated. In some cases over-utilization of such wild leafy vegetable may affect the diversity and create threats to the vegetation. Therefore, both wild and cultivated leafy vegetable plants need to be used in a sustainable manner. Using the present study as a baseline, if the nutrient compositions and other nutraceutical properties of the leafy vegetables, particularly under-utilized species could be determined, it would be possible to alleviate poverty and malnutrition in different corners of world.

– Frances Mae Tenorio & Joselito Baril, Pp. 14484–14489

**Winter food habits of the Common Palm Civet *Paradoxurus hermaphroditus* (Mammalia: Carnivora: Viverridae) in Patna Bird Sanctuary, India**  
– Khursid Alam Khan, Jamal Ahmad Khan, Khursheed Ahmad & Narendra Mohan, Pp. 14490–14495

**Report of five interesting avian species from Durgapur ecoregion, West Bengal, India by citizen science effort**  
– Sagar Adhurya & Shantanu Bhandary, Pp. 14496–14502

**Brief insight into the behavior, activity, and interspecific interactions of urban *Trimeresurus (Cryptelytrops) albolabris* (Reptilia: Squamata: Viperidae) vipers in Bangkok, Thailand**  
– Curt Hrad Barnes & Tyler Keith Knierim, Pp. 14503–14510

**The distributional pattern of benthic macroinvertebrates in a spring-fed foothill tributary of the Ganga River, western Himalaya, India**  
– Vijay Prakash Semwal & Asheesh Shivam Mishra, Pp. 14511–14517

**Seasonal vegetation shift and wetland dynamics in vulnerable granitic rocky outcrops of Palghat Gap of southern Western Ghats, Kerala, India**  
– Pathiyil Arabhi & Maya Chandrasekharan Nair, Pp. 14518–14526

**A comprehensive checklist of endemic flora of Meghalaya, India**  
– Aabid Hussain Mir, Krishna Upadhaya, Dilip Kumar Roy, Chaya Deori & Bikarma Singh, Pp. 14527–14561

**Shola tree regeneration is lower under *Lantana camara* L. thickets in the upper Nilgiris plateau, India**  
– Muneer Ul Islam Najar, Jean-Philippe Puyravaud & Priya Davidar, Pp. 14562–14568

**Overcoming the pollination barrier through artificial pollination in the Wild Nutmeg *Knema attenuata* (Myristicaceae), an endemic tree of the Western Ghats, India**  
– Murugan Govindakurup Govind, Koranapallil Bahuleyan Rameshkumar & Mathew Dan, Pp. 14569–14575

#### Short Communications

**The first photographic record of the Red Panda *Ailurus fulgens* (Cuvier, 1825) from Lamjung District outside Annapurna Conservation Area, Nepal**  
– Ganesh Ghimire, Malcolm Pearch, Badri Baral, Bishnu Thapa & Rishi Baral, Pp. 14576–14581

#### Member

**Dhole *Cuon alpinus* (Mammalia: Carnivora: Canidae) rediscovered in Bardia National Park, Nepal**  
– Shailendra Kumar Yadav, Babu Ram Lamichhane, Naresh Subedi, Ramesh Kumar Thapa, Laxman Prasad Poudyal & Bhagawan Raj Dahal, Pp. 14582–14586

**Observations of Brown Mongoose *Herpestes fuscus* (Mammalia: Carnivora: Herpestidae) in the wet evergreen forests of the Western Ghats, India**  
– Vignesh Kamath & Kadaba Shamanna Seshadri, Pp. 14587–14592

**Further studies on two species of the moth genus *Paralebeda Aurivillius* (Lepidoptera: Bombycoidea: Lasiocampidae) from northwestern India**  
– Amritpal Singh Kaleka, Devinder Singh & Sujata Saini, Pp. 14593–14598

**The genus *Grewia* (Malvaceae: Grewioideae) in Andaman & Nicobar Islands, India with a conservation note on the endemic *G. indandamanica***  
– K.C. Kishor & Mayur D. Nandikar, Pp. 14599–14605

**Three grasses (Poaceae), additions to the flora of Andhra Pradesh, India**  
– Anil Kumar Midigesi & Boyina Ravi Prasad Rao, Pp. 14606–14611

**Ethnobotanical survey of indigenous leafy vegetables consumed in rural areas of Terai-Dooars region of West Bengal, India**  
– Mallika Mazumder & Anup Kumar Sarkar, Pp. 14612–14618

**Australasian sequestrate Fungi 20: *Russula scarlatina* (Agaricomycetes: Russulales: Russulaceae), a new species from dry grassy woodlands of southeastern Australia**  
– Todd F. Elliott & James M. Trappe, Pp. 14619–14623

#### Notes

**The Himalayan Crestless Porcupine *Hystrix brachyura* Linnaeus, 1758 (Mammalia: Rodentia: Hystricidae): first authentic record from Bangladesh**  
– Mohammad Ashraf Ul Hasan & Sufia Akter Neha, Pp. 14624–14626

**A new distribution record of *Asplenium scalare* Rosenst. (Aspleniaceae) in India**  
– Periyasamy Vijayakanth, Jaideep Mazumdar, S. Sahaya Sathish, Veluchamy Ravi & Ramachandran Kavitha, Pp. 14627–14628

#### Response & Reply

**Response to spiders of Odisha: a preliminary checklist additions to the spider checklist of Odisha**  
– John T.D. Caleb, Pp. 14629–14630

**Reply to response: spiders of Odisha**  
– Sudhir Ranjan Choudhury, Manju Siliwal & Sanjay Keshari Das, Pp. 14630
