Abstract: *Antigonon leptopus* is an elegant weedy species that thrives well during wet season in habitats disturbed by humans; it shows vegetative and reproductive events in this season. Its flowers bloom twice with pollen and nectar presentation on day 1 and nectar presentation on day 2 for use by insects that act as pollinators. The flowers are unspecialized with exposed sex organs and presenting pollen and nectar which are easily accessible by the probing insects while collecting the floral rewards and effect pollination. The field study indicates that it acts as a key forage source for insects.

Keywords: Bees, butterflies, elegant weed, nectar, pollen, unspecialized flowers.

Flowering plants commonly depend on insects for pollination (Ollerton et al. 2011). A wide variety or a few taxonomically distinct insects may visit a single plant species for forage collection (Zych et al. 2013). However, all visiting insect species do not act as pollinators since some insects use floral sources without providing pollination service to the plant species they visit for forage collection (Irwin et al. 2010; Castro et al. 2013). Further, the insect species that effect pollination are not equally efficient in providing the pollination service (Schemske & Horvitz 1984; Rosas-Guerrero et al. 2014) and their efficiency in forage collection is

often attributed to the size, morphology, hairiness of mouthparts, and legs (Armbruster et al. 2014). Baker & Baker (1982, 1983) described two categories of flowers, 'bee and butterfly flowers' and 'true butterfly flowers'; in the former category, the flowers are characterized by short-tubed corolla with hexose-rich nectar while in the latter category, the flowers are characterized by deep, narrow corolla tubes with relatively copious sucrose-rich nectar. With this backdrop, the present study was contemplated to investigate the flowers of *Antigonon leptopus* with reference to their role as key forage source for insects, especially bees and butterflies during wet season in habitats disturbed by humans.

MATERIALS AND METHODS

Antigonon leptopus growing in vacant spaces surrounded by residential areas of Andhra University campus and along roadways in Visakhapatnam, Andhra Pradesh, India, was selected for the present study during June–December 2022. The field study was conducted on the flowering season, floral structural and functional aspects, anthesis, floral rewards produced, and flower visitors, their foraging time and foraging activities on

this plant. The data collected on these aspects were examined to know the value of this plant as a forage source for visiting insect species during wet season in areas of human disturbance.

OBSERVATIONS AND DISCUSSION

Antigonon leptopus is an elegant creeper which grows and flowers vigorously during rainy season from June to October (Image 1a). The inflorescence is a compound umbellate cyme which produces several flowers daily during 0630–0830h (Image 1b). The flowers are hermaphroditic, small, showy, pink in color and cup-like. They close back by 1500 h on the first day and re-bloom on the next day along with the new flowers but close back again by 1500 h and remain so until they fall off. They are staminate on the first day with the downward curling of stigmas and pistillate on the second day with complete pollen shedding from the anthers. The flowers produce nectar in day 1 flowers only indicating that day 1 flowers provide both pollen and nectar while day 2 flowers provide left over nectar to insect foragers.

A variety of taxonomically different insects consisting of bees, a wasp and butterflies foraged on the flowers of *A. leptopus* daily during daylight hours from morning to evening. The bees were *Apis dorsata*

(Image 1c), *A. cerana* (Image 1d), *A. florea* (Image 1e), *Trigona iridipennis* (Image 1f), *Xylocopa latipes* (Image 2a), and *X. pubescens*. The wasp included only one species of the genus *Rhynchium* (Image 2b). The butterflies were *Pachliopta aristolochiae*, *P. hector*, *Graphium agamemnon*, *Catopsilia pomona* (Image 2c), *C. pyranthe*, *Eurema hecabe*, *Acraea violae*, *Euthalia aconthea*, *Precis iphita*, *Danaus chrysippus*, *Euploea core*, *Hypolimnas bolina* (Image 2d), *Junonia lemonias* (Image 2e), *Jamides celeno* (Image 2f), and *Euchrysops cneus* (Image 2g) (Table 1). The insects visited day 1 and day 2 flowers indiscriminately to collect pollen and/or nectar. Bees obtained both pollen and nectar from day 1 flowers and only left over nectar from day 2 flowers; the nectar availability in day 2 flowers depended on the utilization level of nectar by insects in day 1 flowers. The wasp and butterflies collected only nectar and use day 1 and day 2 flowers as nectar sources. Since flowers are small and cup-like with sex organs well exposed characterizing unspecialized floral syndrome, all foraging insects reached pollen and/or nectar easily and while collecting the forage they contacted the sex organs and pollinated the stigmas automatically (Burkill 1916; van der Pijl 1937). Raju et al. (2001) reported that since the flowers display temporal dioecy with

either male or female phase at any given day, there is no possibility for self-pollination within the flower but facilitate self-pollination (geitonogamy) within the plant. The plant with intense flowering during wet season and unspecialized flowers is a key source of pollen and nectar for bees and of nectar for wasps and butterflies in habitats disturbed by humans.

CONCLUSION

The study indicates that *A. leptopus* with flowers opening twice is a key forage source for insects during wet season in areas where human disturbance results in decimation of plant cover and reduced species diversity.

Reviewers 2020–2022

Due to paucity of space, the list of reviewers for 2020–2022 is available online.

The opinions expressed by the authors do not reflect the views of the Journal of Threatened Taxa, Wildlife Information Liaison Development Society, Zoo Outreach Organization, or any of the partners. The journal, the publisher, the host, and the partners are not responsible for the accuracy of the political boundaries shown in the maps by the authors.

Print copies of the Journal are available at cost. Write to:
The Managing Editor, JoTT,
c/o Wildlife Information Liaison Development Society,
43/2 Varadarajulu Nagar, 5th Street West, Ganapathy, Coimbatore,
Tamil Nadu 641006, India
ravi@threatenedtaxa.org

Journal of Threatened Taxa is indexed/abstracted in Bibliography of Systematic Mycology, Biological Abstracts, BIOSIS Previews, CAB Abstracts, EBSCO, Google Scholar, Index Copernicus, Index Fungorum, JournalSeek, National Academy of Agricultural Sciences, NewJour, OCLC WorldCat, SCOPUS, Stanford University Libraries, Virtual Library of Biology, Zoological Records.

NAAS rating (India) 5.64

OPEN ACCESS

The Journal of Threatened Taxa (JoTT) is dedicated to building evidence for conservation globally by publishing peer-reviewed articles online every month at a reasonably rapid rate at www.threatenedtaxa.org. All articles published in JoTT are registered under [Creative Commons Attribution 4.0 International License](#) unless otherwise mentioned. JoTT allows unrestricted use, reproduction, and distribution of articles in any medium by providing adequate credit to the author(s) and the source of publication.

Article

Use of remote sensing and GIS in assessing the impact of *Prosopis juliflora* proliferation on land use, land cover and diversity of native flora at Point Calimere Wildlife Sanctuary, India

– Sourav Gupta, Subhasish Arandhara, Selvarasu Sathishkumar & Nagarajan Baskaran, Pp. 24451–24462

Communications

Two *Ceratosporella* (Fungi: Ascomycota) species from oak leaf litter in Almora, Uttarakhand, India

– Manish Kumar Dubey, Ram Sanmukh Upadhyay & Ramesh Chandra Gupta, Pp. 24463–24468

The genus *Holigarna* Buch.-Ham. ex Roxb. (Anacardiaceae) in the central Western Ghats, Karnataka, India

– Kumbar Mudakappa Manjunath, H.S. Shashwathi, H.M. Rakshitha Jain & Y.L. Krishnamurthy, Pp. 24469–24484

Report of *Bathycoelia indica* Dallas, 1851 (Hemiptera: Heteroptera: Pentatomidae) as a pest of pomegranate *Punica granatum* L. cultivated in Maharashtra State

– P.S. Kudnar, Gaurang G. Gowande & Hemant V. Ghate, Pp. 24485–24495

First documentation of diversity of the Heteroptera of Cotton University Campus, Kamrup (Metropolitan), Assam, India

– Santana Saikia & Anjana Singha Naorem, Pp. 24496–24502

Checklist of hawkmoths (Lepidoptera: Bombycoidea: Sphingidae) in the Central Highlands of Vietnam

– Trang Q. Le & Lien V. Vu, Pp. 24503–24528

Observations on the courtship behaviour of Deocata Pipefish *Micropis deocata* (Hamilton, 1822) (Actinopterygii: Syngnathiformes: Syngnathidae) in an aquarium

– Anu Saikia, Jayanta Kumar Nath & Dandadhar Sarma, Pp. 24529–24534

Freshwater fish diversity and IUCN Red List status of glacial-fed (Bheri) and spring-fed (Babai) rivers in the wake of inter-basin water transfer

– Kumar Khatri, Bibhuti Ranjan Jha, Smriti Gurung & Udhav Raj Khadka, Pp. 24535–24549

Population status and habitat use of White-crested Kalij Pheasant *Lophura leucomelanos hamiltoni* (J.E. Gray, 1829) in the Limber Wildlife Sanctuary, Jammu & Kashmir, India

– Arif Nabi Lone, Bilal A. Bhat & Khursheed Ahmad, Pp. 24550–24556

Assessment of diversity, abundance, and seasonal variations of bird species in Bengaluru District, India during COVID-19 lockdown

– H. Hemanth, Rajalakshmi K.S. Vinanthi & Kuppusamy Alagesan Paari, Pp. 24557–24567

An annotated checklist of the birds in Loharghat Forest Range, Assam, India

– Tanya Talwar, Leons Mathew Abraham, Borojit Rabha & Mrigen Rabha, Pp. 24568–24583

Trade of skulls as novelty and aquarium objects are an additional threat to porcupines

– Jessica Chavez, Kuntayuni & Vincent Nijman, Pp. 24584–24588

Review

Fishes of Cocibolca, the great Central American lake

– Topiltzin Contreras-MacBeath, Byron Josue Rodríguez Pérez, Humberto Mejía-Mojica & Juan Manuel Rivas-González, Pp. 24589–24596

Short Communications

Twice blooming flowers of *Antigonon leptopus* Hook. & Arn. (Magnoliopsida: Caryophyllales: Polygonaceae), a key forage source for insects during wet season in habitats disturbed by humans

– P. Suvarna Raju, P. Srikanth & A.J. Solomon Raju, Pp. 24597–24600

Two new weevil species of the genus *Myllocerus* Schoenherr, 1823 (Coleoptera: Curculionidae: Entiminae) from India

– G. Mahendiran, M.M. Nagaraja & M. Sampathkumar, Pp. 24601–24606

Notes

Additional record of the Black Turmeric *Curcuma caesia* Roxb. (Zingiberales: Zingiberaceae) in Bhutan

– Karma Orong, Namgay Shacha, Kezang Tobgay & Rinchen Namgay, Pp. 24607–24610

A record of Chestnut-and-Black Royal *Tajuria yajna istrodea* De Nicéville, 1887 (Lepidoptera: Lycaenidae) from Arunachal Pradesh, India

– Ruksha Limbu, Ramandeep Achint, Renu Gogoi, Roshan Upadhyaya & Jyoti Gaur, Pp. 24611–24614
